

Why Switch to Wireless Arthroscopy?

Dear Colleague,

Over the years, we've all wrestled with cords in the OR—tangled bundles that get caught on sterile drapes, limit mobility, and add unnecessary difficulty in the operating room. That's why I made the switch to the *ArthroFree® Wireless Camera System*, and I encourage you to consider doing the same.

The difference is immediate. With less cords, there's significantly less dragging on sterile drapes, and the infamous "bird's nest" around the surgical field is dramatically reduced. Having fewer cords facilitates easier movement around the operative field, less challenges when switching between portals in complex cases, and less likelihood of inadvertently causing things to fall off of the field when the different cords get tangled up with one another; thus making surgery more efficient and helping to reduce cost.

The system is fast and intuitive to set up, which streamlines workflows and quickens turnover times. Additionally, there's the elimination of the risk of camera cable-related burns and OR fires—a safety improvement that brings peace of mind to everyone in the room.

Importantly, these benefits don't come at the expense of quality—the imaging is excellent, the performance is consistent, and the reliability is everything you'd expect from a high-performance wired system.

If you've been looking for a way to enhance efficiency and reduce stress in your OR without a steep learning curve or complicated integration—this is it.

I'd be happy to share more details about my experience with the product. Feel free to reach out to me anytime.

Sincerely,

Michael S. Schwartz, M.D., M.B.A.
